

## **Wireless network solutions for the enterprise from wirelessworkplace™**

The business benefits of exploiting wireless technologies in the workplace are clear, measurable and significant. Every day, more and more businesses are realising these benefits, and not just for their mobile professionals, but equally for office-based staff.

Wirelessworkplace™ specialises in delivering real business benefit through wireless technologies such as Wireless Local Area Networks (WLANs) using 802.11b (Wi-Fi) and related standards and Wireless Personal Area Networks (WPANs) based on Bluetooth technologies.

Wirelessworkplace™ will help you to work without wires...

### **Key business benefits**

The key business benefits of wireless network solutions are reduced cost and increased productivity through greater flexibility and mobility:

#### **Mobility**

The freedom to move anywhere, anytime within a building or multi-building campus and remain connected to real-time information. Laptop or PDA users can access broadband internet services, email and the corporate network wherever they choose to be on-site.

#### **Flexibility**

Public areas, meeting rooms and the whole office space become more flexible. Use the space how you like, when you need to. Hot desks are created wherever you place your laptop. The wireless network gives you the extra capacity you need instantly, wherever you need it in your office space. Project teams, ad hoc groups and others that might need temporary networks can be accommodated instantly.

#### **Productivity**

All users can access the resources they need, when they need them. Remote workers and field workers can connect as soon as they arrive at your office. Since you stay connected to the network, you can enter data while on the move.

#### **Reduced cost**

Installing or expanding a wireless network is fast and easy. It avoids the time, cost, complexity and disruption of pulling cables through walls and ceilings. Add, moves and changes within your organisation become less time consuming and costly. Less is spent when offices are reconfigured or as your company grows.

## Why wirelessworkplace™?

At wirelessworkplace™ we understand wireless networks – we are 100% focussed on wireless. Our goal is to help our clients realise business benefit through the use of the latest, tried and tested, secure wireless technologies.

Whether you are already exploiting wireless networks in your business or planning to install a wireless network, wirelessworkplace™ can help. We offer a range of services including:

### Wireless network pilot studies

We can help you understand the benefits of wireless by initiating and implementing test cases or pilot studies within your organisation.

### Wireless network planning

Our planning services are designed to enable the effective installation and use of wireless technologies in your organisation.

- **site surveys**

We will determine the optimum placement of network components given your building construction and space utilisation to achieve your objectives for connectivity, cost and throughput.

- **intrusion surveys (adjoining network detection)**

We will investigate usage of wireless technologies in adjoining facilities and potential impact on your workplace.

- **interference avoidance**

Our networks can be designed to avoid potential interference from existing radio devices.

### Security planning

We can design your wireless network to encompass the latest security options and to integrate with your corporate security policies.

### Wireless network installations

Whether you require a simple wireless network or a large campus installation, we can help you to plan, install and manage your network securely and effectively.

## **Workplace impact assessment**

We can help you understand the effects of wireless technology on your workplace environment and what that can mean for your workforce and your business.

## **Technical support and management**

We can provide ongoing support and network management services for your wireless network.
